

Whiplash

You are waiting at a stoplight. The sound of screeching tires is followed by the harsh sound of metal hitting metal. Your car is suddenly being pushed forward!

You are being rear-ended!!!

In a split second, your body is pushed against your seat. Your head, isolated by your neck, delays its reaction.

Then, your body changes directions, moving forward to the limits of your seatbelt. The your head is snapped backwards! You can't stop it.

Even a minor fender bender can produce a whiplash injury. It may take a day or two, or sometimes months for symptoms to appear. NOW WHAT?

Specific chiropractic spinal adjustments can help restore motion and position of individual spinal bones and can help promote proper healing.

The longer you wait the more unseen damage there is and the longer it seems to take to recover....
